

NAME

`curl_multi_remove_handle` - remove an easy handle from a multi session

SYNOPSIS

```
#include <curl/curl.h>
```

```
CURLMcode curl_multi_remove_handle(CURLM *multi_handle, CURL *easy_handle);
```

DESCRIPTION

Removes a given `easy_handle` from the `multi_handle`. This will make the specified easy handle be removed from this multi handle's control.

When the easy handle has been removed from a multi stack, it is again perfectly legal to invoke `curl_easy_perform()` on this easy handle.

Removing an easy handle while being used, will effectively halt the transfer in progress involving that easy handle. All other easy handles and transfers will remain unaffected.

RETURN VALUE
